

Python

Michael König

Introduction

Nowadays web development is much more than two or three technologies and can be quite (or rather *extremely*) overwhelming with all those names. Telling you "*It's actually not that much*" would be a lie as it's more like the opposite.

However it doesn't take much of an overview to get started: By just using two markup languages (HTML & CSS) as well as Javascript (a programming language) you can do lots of stuff.

Actually, lots of the technologies you've maybe heard about - like React, Node.js, SASS build upon those languages and add some things to them or make your life as a web developer easier.

Note that this is my no means a tutorial but should give you a general overview of the technologies available out there.
